

How to install the application “posit-haiti09-root.apk” for beneficiary registration

This application was developed on Android platform. It should be installed only on Android Smartphones

1. Save the application on the Smartphone SD card
2. Launch any file manager on the Smartphone, like “**es file explorer**” or any others.
3. Choose “**Posit-haiti**” and **install**. After installation, Open it
4. To test the app, enter with username **admina** and password **bake** for Maternal and Child Health and Nutrition, or username **agrana** and password **cabs** for Livelihoods.
5. After logging with any of these accounts, you will be able to configure the application to send all data entered to a specific phone number. To do so, choose **Menu, Settings, ACDI/VOCA Preferences**. In **SMS Phone Target**, enter the phone number (example: +50936201425) to which all data entered in the application will be sent. On the same page, you can enable a barcode scanner, local language, etc. Once finished, go back two times. The first button you’ll see is for **New Beneficiary’s Registration**. After each registration, you must save it on the phone memory card by choosing the **Save to DB** button. Once finished with registration, you are ready to send the data to the specific phone number configured above.
6. In the case of ACDI/VOCA, the SIM card was inserted to a modem connected to a server. An application called Frontline SMS was installed on the server and used for SMS storage. Each SMS received from the application was stored in Frontline SMS and deleted from the SIM card on the smart phones to prevent the SIM card from being full. Then ACDI/VOCA used a java application to interpret all of the SMS messages.

After installing this software onto your Android Smartphone, use the *Software User’s Manual: ACDI/VOCA Mobile phone based Beneficiary Registration & Update System* for more information on how to use this software.
